

FIRE LINE DISPERSAL SYSTEM

ABSTRACT OF THE DISCLOSURE

A fire suppression dispersal system for an airborne craft which applies fire suppressant material at or near ground level. The system includes a vessel that is secured within or adjacent the airborne craft for holding a fire suppressant material therein. A dispenser controllably dispenses the material from the vessel. A conduit has a first end secured in fluid communication with the vessel and a second end connected to a dispensing end for controllably directing the dispensed material at or near ground level. The dispensing end which dispenses fire suppressant material is enclosed within a protective shroud for impact protection from the encountered terrain.
